Transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptome, and in detecting RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised minicanscriptomes. The libraries may also be used as specialised minicanscripts of a sub-transcriptome under a particular libraries to detect franscripts of a sub-transcriptome under a particular conficionary specific genes such as those genes only expressed in specific tissue under a specific pathological condition; to detect converse to the condition of the sub-transcripts of a sub-transcripts and splice converse of the such as those genes of the such as those genes of the such as the sub-transcripts of the variance of a transcriptome of a patient suffering from a particular disorder. ABN27253 to ABN59589 represent oligonucleotide sequences from rats, humans and mice, which are used in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple

New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular WPI; 2004-479808/45.

Claim 1; SEQ ID NO 9639; 34pp; English.

tags to map genes.

The invention relates to 17880 cotton expressed sequence tags (ESTB;
ACN45220-ACN63099). The ESTB were isolated from CDNA libraries generated
CC ACN45220-ACN63099). The ESTB were isolated from cDNA libraries generated
CC from prizined or non-primed seeds from variety DPSOB, mature seeds from
variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
c variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
CC tissue, developing fibres, carpel walls and septa from variety
CC formation; and to transformed plants and septa from variety
CC comprising a nucleic acid of the invention. The cotton ESTB are useful as
CC comprising a nucleic acid of the invention. The cotton ESTB are useful a
CC comprising a nucleic acid of the invention. The cotton ESTB are useful
CC comprising a nucleic acid of the invention. The cotton and catabolic pathways. The nucleic acid molecules are
used for isolating a variety of agronomically significant genes
cassociated with plant growth, quality, yield, and could also serve as
clinks in metabolic and catabolic pathways. The nucleic acid molecules are
also useful for identifying genes important in initiating and maintaining
cs end germination or that may be used to mitigate stresses encountered
during seed germination. The ESTB additionally enable the acquisition of
coronomically significant genes in these tissues and/or other tissues,
and also permits the acquisition of molecular markers useful in breeding
cs genemas, genetic and molecular markers useful for
detecting the expression level or pattern of a protein or mRNA and for
detecting the expression level or pattern of a protein or mRNA and for
cotton variety Nucotton33B androecium tissue cDNA library (L183828). The
cotton variety Nucotton33B androecium tissue commerced at a pecificant or man a cotton contractor or quantity of permits of pression or parent of the prime of permits of permits of permits or man a physical parent with a permit of permits or permits or permits or parent or pattern or pattern or pattern from the US specification, but was obtained in electronic format directly from tl patent office at segdata.uspto.gov/seguence.html?DocID=US20040123340

The invention relates to 17880 cotton expressed sequence tags (ESTs; ACM5220-ACM53099). The ESTs were isolated from cDNA libraries generated from primed or non-primed seeds from variety DB50B, mature seeds from variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium tissue, developing fibres, carpel walls and septa from variety Nucotton33B. The invention also relates to substantially purified proteins or their fragments encoded by nucleic acid molecules of the invention, and to transformed plants having a nucleic acid construct comprising a nucleic acid of the invention. The cotton ESTs are useful as molecular tags to isolate genetic regions, to isolate genes, to map
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cotton; plant; EST; expressed sequence tag; transgentc plant; androecium; variety Nucotton33B; library LIB382B; molecular tag; molecular marker; genetic mapping; molecular mapping; seed germination; plant growth; plant quality; plant yield; plant breeding; tissue printing; ss.
                                                                                                                                                                                                                                                                                         from the US
and also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically significant genes. The nucleic acid molecules are further useful for detecting the expression level or pattern of a protein or mRWA and for detecting the presence or quantity of a protein by tissue printing. The present sequence represents a specifically claimed EST isolated from a cotton variety Nucotton33B androecium tissue cDNA library (LIB3828). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the US patent office at seqdata.uspto.gov/sequence.html?DocID=US20040123340
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cotton androecium tissue EST Clone ID: LIB3828-012-Q1-N6-A4, SEQ:6000.

genes, to determine gene function and to determining whether genes are members of a particular gene family. The nucleic acid molecules may be used for isolating a variety of agronomically aignificant genes associated with plant growth, quality, yield, and could also serve as links in metabolic and catabolic pathways. The nucleic acid molecules are also useful for identifying genes important in initiating and maintaining seed germination or that may be used to mitigate stresses encountered during seed germination. The ESTs additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express are also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically significant genes. The nucleic acid moleculas are further useful for detecting the expression level or pattern of a protein or mRNA and for detecting the presence or quantity of a protein by tissue printing. The present sequence represents a specifically claimed EST isolated from a sequence data for this pattent did not form part of the printed from a sequence data for this pattent did not form part of the printed specification, but was obtained in all commit former presents as sequence. The printed from the specification, but was obtained in alectronic format directly from the US patent office at sequence.html?DocID=US20040123340

Screening an agent for its ability to modulate RNA processing comprises contacting the agent with a sample comprising tristetraprolin (TTP), a poly(A)-preferring, 3'-5' ribo-exonuclease (PARN) polypeptide and an RNA. Example; SEQ ID NO 35; 94pp; English

The present sequence is that of an T50 element found in RNA probes used in examples from the invention. The invention provides a method for screening an agent for its ability to modulate RNA processing. The method comprises (a) contacting the agent with a sample comprising (i) tristetraproline (TTP), TTP-related polypeptide, fragment or variant, (ii) a polyA-preferring 3'-5'-ribo-exonuclease (PARN) polypeptide or its

active fragment or variant (if the PARN is in a cell, the cell comprises exceptions PARN) and (iii) an RNA which comprises an ARE downstream of a reporter sequence and a 1 polyh tail, where processing of the RNA can be detected, under conditions effective for processing and, optionally, cranslation of the RNA, and (b) detecting processing of the RNA, e.g. by measuring the amount and/or structure of the RNA, deadenylation of the RNA, or binding of the TTP to the ARE. The method can be used to screen for an agent able to inhibit RNA processing for the treatment of a condition mediated by insufficient granulocyte-macrophage colony stimulating factor or for treating granulocyte-macrophage colony stimulating factor or for treating granulocyte-macrophage colony condition mediated by excess tumour necrosis factor-alpha, an a condition mediated by excess tumour necrosis factor-alpha, an arthritis (all claimed). The method can be conducted in vitro or in a rathritis (all claimed). The method can be conducted in vitro or in a arthritis (all claimed). The method can be conducted in vitro or in a coll-based format. A high-throughput screening method may be used.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated cardiac hypertrophy factor (GHF), excluding rat CHF. The cardiac hypertrophy factor (also known as cardiotrophin or cardiotrophin-1) is useful for treating cardiac hypertrophy, heart failure, arrhythmic or inotropic disorder, congestive heart failure and neurodegenerative diseases such as peripheral neuropathies, Alzheimer's disease, stroke, or Parkinson's disease. The nucleic acid and antibody are useful as diagnostic reagents. The present sequence represents oligonucleotide ocdl.1.3 used in construction of a
measuring the amount and/or structure of the RNA, deadenylation of the RNA, or binding of the TTP to the ARE. The method can be used to screen for an agent able to inhibit RNA processing for the treatment of a condition mediated by insufficient granulocyte-macrophage colony stimulating factor or for treating granulocytopenia. It may also be used to screen for an agent able to stimulate RNA processing for treatment of a condition mediated by excess tumour necrosis factor-alpha, an inflammatory condition, rheumatoid arthritis, Crohn's disease or arthritis (all claimed). The method can be conducted in vitro or in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ss; cardiac hypertrophy factor; CHF; cardiotrophin; cardiotrophin-1; cardiac hypertrophy; heart failure; arrhythmic; inotropic disorder; congestive heart failure; neurodegenerative disease; peripheral neuropathy; Alzhelmer's disease; stroke; Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated cardiac hypertrophy factor (cardiotrophin), useful for
treating heart failure, arrhythmic disorders and neurodegenerative
                                                                                                                                                                                                                                                                                                               cell-based format. A high-throughput screening method may be used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligonucleotide ocdl.1.3 used in construction of a cDNA library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to a novel composition comprising a substance that the invention relates to a novel composition comprising a substance that modulates the status of 238P1B2, or a molecule that is modulated by the invention further relates to: a non-human transgenic animal configuration that configuration can antibody; a hybridoma that produces an antibody; a polymucleotide that encodes a peptide; a capture composition cated above, in parmaceutical composition that comprises the composition cated above, in the man unit dosage form, where the substance comprises: a ribozyme that a human unit dosage form, where the substance comprises: a ribozyme that composition that comprises and earning sequence or a nucleic acid cleaves a polymucleotide having 138P1B2 coding sequence or a nucleic acid composition. The molecule inhibiting growth of cancer cells that express peritically recognise a 238P1B2 peptide sequence in the context of a specifically recognise a graph of a carrier; or human T-cells that express cancer in an individual mammalian immune response directed to 238P1B2; and sasay for detecting the presence of a 238P1B2. related protein or cancer in an individual. The novel composition has cytostatic activity. The 238P1B2 polypacide can be used in gene therapy to treat cancer: The 238P1B2 polypacide can be used in detecting, preventing, vaccine. The composition and methods are useful in detecting, preventing, prognosing or treating cancer (e.g. prostate cancer). The genes, proteins or antibodies can be used as a probe or a primer, or in chromosomal mapping. This polypucleotide represents a primer used in the chromosomal mapping. This polypucleotide represents a primer very in the composition of the invention.
                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                             238P1B2; transgenic animal; cytotoxic; cancer; cytostatic; gene therapy; vaccine; prostate cancer; humoral; cellular immune response; primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequencing p812 revealed that the cDNA insert was within the EcoRI and XhoI sites of that plasmid and was directionally correct by out of frame with respect to the beta-galactosidase sequences. To improve the production of galactinol syntase, p821 was modified to place the galactinol synthase sequences in-frame with those of beta-galactosidase. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleotide sequence of galactinol synthase from zucchini and soybean - used to produce plants having altered levels of raffinose saccharide(s)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                               The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (FI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding P13K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of F13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a probe which hybridises to DNA encoding the human F13K regulatory subunit 4, p150 polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3 kinase, regulatory subunit 4, p150. The phosphoinositide-3 kinase, regulatory subunit 4, p150. The coligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory cancer, chediak-Higashi syndrome or a metabolic disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tospovirus resistance; transgenic plant; tomato spotted wilt virus;

```
two binding moieties having specificity for different binding sites on the same target. (C) is useful for treating euplastic tumour growth and disease associated with angiogenesis or hyperproliferation (claimed). (C) is useful for treating diseases such as arthritis, atherosclerotic plaques, corneal graft neovascularization or ocular diseases. (C) is small and can more easily reach a target. (C) localizes more effectively to the target site than other targeting compounds due to its binding to more than one site on the same target. This sequence represents a DNA oligomucleotide used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a multivalent compound (C) comprising at least
                                                                                                                                                                                                                                                                                                                                                                                         Multivalent compounds with at least two binding moities having specificity for different binding sites on the same target, useful for treating and diagnosing, e.g. angiogenic and hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ss; deposition unit misalignment; polymeric array synthesis; pulse jet misalignment; printhead misalignment; microarray.

The invention relates to a method of detection of deposition unit misalignment of an in situ polymeric array synthesis device which comprises synthesising test probe feature(s) on substrate using in situ polymeric array synthesis device, contacting test probe feature using in situ polymeric array synthesis device, contacting test probe feature with at binding of labelled targets to test probe feature to detect any pulse jet misalignment of polymeric array synthesis device. The method is useful for detecting deposition unit misalignment e.g. printhesi device. The method is easy to use, cost effective. effective at detecting printhese misalignments and may enable immediate detection and/or adjustments of one or more printheses of an in situ nucleic acid array synthesis fluid deposition device if misalignment is detected. The present sequence represents an oligonucleotide synthesised on a microarray.
                                                                                                                                                                                                                                    Detection of deposition unit misalignment of in situ polymeric array synthesis device, by contacting test probe feature with different distinguishably labeled targets, and evaluating binding of labeled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detection of deposition unit misalignment of in situ polymeric array synthesis device, by contacting test probe feature with different

                                                                                  The invention relates to a method of detection of deposition unit misalignment of an in situ polymeric array synthesis device which comprises synthesising test probe feature(s) on substrate using in situ polymeric array synthesis device, contacting test probe feature with at least two different distinguishably labelled targets and evaluating binding of labelled targets to test probe feature to detect any pulse jet of detecting deposition unit misalignment e.g. printhead misalignment, of an in situ polymeric. e.g. nucleic acid, array synthesis device. The method is easy to use, cost effective. effective at detecting printhead misalignments and may enable immediate detection and/or adjustments of one or more printhead of an in situ nucleic acid array synthesis fluid deposition device if misalignment is detected. The present sequence represents an oligonucleotide synthesised on a microarray.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PCR primers MB2 (AAT68809) and MB3 (AAT68810) are based on the nucleotide sequences for the Bacillus amyloliquefaciens sacB gene and the polylinker region of pBES04. MB3 overlaps Arg codon 331 of the sacB(BamP) W29 mutant gene (see also AAT68806) and was designed to convert codon 331 into a Leu codon in the amplified DNA. The primers were used to amplify a region of plasmid pMGB161delcat1 that included the 473 bp between the BBSHII and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ormed Gram positive bacteria, especially heterologous genes encoding e.g. industrial

```
The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified sugar moiety, and for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a PCR primer used to amplify DNA encoding the human PI3K
                                                                                                                                                                                                      ö
BamHI restriction sites. The mutation showed that the polymerase activity of the sacfBlamP) w29 gene product is necessary for inhibition of growth on medium with sucrose by sacB(BamP) w29. Inactivation of sacB(BamP) w29 could be used to select for growth of colonies of B. subtilis with cloned
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; PCR; ss; antisense oligonucleotide; phosphorothioate linkage; 2-0-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial; antiinflammatory; primer.

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, [2, 15, 15]. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypetide. The antisense oligonuclectide comprises at least one modified internucleoside linkage oligonuclectide comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified cucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a PCR primer used to amplify DNA encoding the human P13K regulatory subunit 4, p150 polypeptide of the invention.

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphonositide. Strinase, regulatory subunit 4, piso. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory chediak-Higashi syndrome or a metabolic disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinostided-3-kinase, regulatory subunit 4, p150. The phosphoinostided of an insering to endottied internucleoside linkage, oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified undebbase, preferably a 5-methylcytosine. The antisense oligonucleotide conclusion be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higabhi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for determining if a gene product or compound is involved in preventing replication error in a cell. The method involves providing a cell with a specific inhibitor for a gene product or with a compound and determining the expression level of is dependent on the occurrence of a replication error. The invention is useful in gene therapy and for treating a subject having tumours or cancer. The present sequence is a Caenorhabditis elegans heat-shock promoter DNA. This sequence is used to illustrate the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining if a gene product/compound is involved in preventing replication error in a cell, useful for treating cancer, comprises determining expression level of a marker gene in a cell treated with gene product inhibitor/compound.

                                                                                                       PCR primers AAV03153-54 were used to amplify a terminator region of the PR-la gene from tobacco. This fragment was used to create a a recombinant gene in which a gene encoding an anti-bacterial peptide (e.g. sarcotoxin la) is bound to a plant gene via a hinge region of tobacco chitinase, an expression cassette in which the recombinant gene is bound to a plant promoter, and a gene having the expression cassette and a drug resistance gene linked to a plant promoter which is constitutively expressed. Plants transformed with this expression vector are resistant to pathogenic fungi
Plant resistant to pathogenic fungi and bacteria - especially containing insect gene encoding sarcotoxin la.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Barnase; barstar; IPCR; inverse polymerase chain reaction; phenotype; transgenic plant; hybrid seed; male sterile plant; active enzyme; regulatory protein; embryoless seed; herbicide resistance; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a pair of parent plants for producing seeds comprising: (a) a first parent plant containing at least 1 gene sequence encoding a polypeptide or protein A, and (b) a second parent plant containing at least 1 gene sequence encoding a polypeptide or protein B; where the polypeptides A and B, when expressed in separate plants, do not form an active enzyme, a regulatory protein or protein chick affects the functionality and/or viability and/or the structural integrity of a cell, but when expressed in the same plant do form an ective enzyme, regulatory protein, or protein which affects the structural integrity of a cell. Also described is a method for producing a plant having a desired phenotype by virtue of an active enzyme, a cell contains or a protein which affects the structural integrity of a cell comprising crossing a first line with a second line where the first line contains one or more gene sequences encoding a polypeptide or protein. A but which line does not have the desired phenotype and where
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the second line contains one or more gene sequences encoding a polypeptide or protein B which is complementary to the polypeptide or protein A but which line does not have the desired phenotype. The method can be used for producing plants having altered phenotypes, e.g. malesterility, embryoless seeds, altered blochemical (e.g. fatty acid) composition or herbicide resistance. The present sequence represents an inverse PCR (IPCR) primer which is used in an example from the present
                                                                                                                                                                                                                                                         Production of transgenic plants having a desired phenotype - by using a pair of parent plants which each produce a polypeptide which complement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; GM2 activation protein 14; recombinant production; malignant tumour; cancer; blood disease; HIV infection; human immunodficiency virus; immune disorder; inflammatory condition; familial cretinism; embryonic disorder; developmental disorder; nervous system disorder; gene therapy; cytostatic; anti-HIV; anti-HI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to numen GMZ activation protein 14 (AMPAD2A3), and a method for the recombinant production of GMZ activation protein 14. The protein has a molecular weight of 14 MD. The present inventionally discloses an antagonist of GMZ activation protein 14. The protein last seeds an antagonist of GMZ activation protein 14 for therapeutic use, and an artibody which specifically binds to GMZ activation protein 14. and nucleotides which encode it may be used for treating a variety of diseases, and inclocatides which encode it may be used for treating a variety of diseases, and inclocation will infection, immune disorders, inflammatory conditions, familial cretinies, embryonic and developmental disorders, and nervous system disorders. The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification. The polymucleotide can be used as a primer for nucleic coid amplification reactions or as a probe for hybridisation reactions, or in producing gene chips or microarrays. Sequences ABA02434-ABA02435 community is activated when the protein protein protein protein protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          exemplification of the invention to isolate human GM2 activation protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, molecular chaperone cpn60 protein 14; chaperone; tumour;

The protein has a molecular weight of 12.54 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Zinc finger protein, 12.54 can be used in the treatment of a variety of diseases such
                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polypeptide-human zinc finger protein 12.54 and polynucleotide for coding
                                                                                                  The invention relates to human molecular chaperone cpn60 protein 14, polynucleotide encoding for this polypeptide and a method for producing this polypeptide by using DNA recombinant techniques. The invention also discloses the method for curing several diseases, such as malignant tumour, haemopathy, HIV infection, immunological disease and various inflammations by using the polypeptide. The invention also discloses an antagonist for resisting said polypeptide and its therapeutic action and the application of polynucleotide encoding this novel human molecular chaperone cpn60 protein 14. The present sequence is that of a human molecular chaperone cpn60 protein 14 PCR primer, useful in examples of
                                        New polypeptide human chapronin CPN 60 protein 14 and polynucleotides for encoding same.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; zinc finger protein 12.54; recombinant production; gene therapy; cancer; tumour; human immunodeficiency virus; HIV infection; cytostatic; reverse transcription-PCR; RT-PCR; primer; 8s.

The present invention relates to a method for determining if a gene product or compound is involved in preventing replication error in a cell. The method involves providing a cell with a specific inhibitor for a gene product or with a compound and determining the expression level of a marker gene in the cell, where the expression level of the marker gene in the cell, where the expression level of the marker gene is dependent on the occurrence of a replication error. The invention is useful in gene therapy and for treating a subject having tumours or cancer. The present sequence is a Caenorhabditis elegans heat-shock promoter DNA. This sequence is used to illustrate the method of
                                                                                                                                                                                                                                                                       ö
as cancer and HIV (human immunodeficiency virus) infection. Sequences ABZ57354-ABZ57355 represent reverse transcription-PCR (RT-PCR) primers used in an exemplification of the invention to isolate human zinc finger protein 12.54 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Determining if a gene product/compound is involved in preventing replication error in a cell, useful for treating cancer, comprises determining expression level of a marker gene in a cell treated with a gene product inhibitor/compound.

acid molecules and the encoded proteins thereof. Specifically, it refers to enzymes that are calcium dependent phosphotriesterases essential to the detoxification process of organophosphates such as the insecticide proaxon and the nerve agents sarin and soman. The present invention describes a method to identify mutated PONs that exhibit substantially identical (or improved) substrate specificity in comparison with the wild expressed in bacteria. In particular, the method employed an in vitro expressed in bacteria. In particular, the method employed an in vitro evolution process to identify proteins with desired traits such as structural plasticity, catalytic activity and maintaining substrate binding. These mutants have been found to be useful for treating or preventing PONI-related diseases including hyperlipidaemia.

The present invention provides the protein and coding sequences of the Zea mays ZmWADS2 protein, which is specifically expressed in pollen. The sequences can be used to produce male sterile plants, as ZmWADS2 is essential for pollen tube growth. These are useful in hybrid breeding, particularly of corn, cereal and grain. The present sequence is a PCR primer for the ZmWADS2 coding sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to regulatory elements (AAF76067) from the maize MADS box gene ZmwADS2 (AAF76068) which are capable of directing capression in a pollen-specific manner. The ZmwADS2 protein (AAB73333) is expression in a pollen-specific manner. The ZmwADS2 protein (AAB73333) is capressed particularly in mature pollen after dehiscence, indicating that it has an essential role in pollen development and function, in particular in pollen tube growth. The invention also relates to vectors particular in pollen tube growth. The invention also relates to vectors and host cells comprising the ZmwADS2 regulatory or generation of transgenic plants. The ZmwADS2 regulatory sequences are useful for cloning and expressing a pollen-specific or pollen-abundant gene in a plant, and may also be used to drive the capression of a gene of interest in a pollen-specific or pollen-preferred commence. The ZmwADS2 regulatory sequences are useful for isolating related regulatory sequences of other plant species which confer pollen or group crequences are useful in plant breeding, especially for the production of hybrid seed. In particular, they may be used to drive the production of hybrid seed. In particular, they may be used to drive the pollen-specific expression of heterologous genes which confer nuclear or cytoplasmic male captality in transgenic plants (e.g., cereals). Sequences AAF76081.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                             pBluescript vector PCR primer, SEQ ID:26, used to isolate ZmMADS2 cDNA.

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound its an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified concleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #34.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antiense oligonuclectide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation;
                                                                                      New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cytostatic; immunomodulator; neurodegenerative; antimicrobial;

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 6, p150 and inhibits expression of the polypeptide. The antisense coligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably a 2'-0-methoxyethyl sugar molety, or at least one modified in cucleobase comprising a 5-methylcytoshine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and cancer), chediak-Higashi syndrome, neurodegenerative disorders and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #51.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gape

                                                                                           The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human P13K regulatory subunit 4, p150 DNA antisense oligonucleotide #58.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cancer), Chediak-Higashi syndrome, neurodegenerative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety, or at least one modified
hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense coligonucleotide comprises at least one modified internucleoside linkage oligonucleotide comprises at least one modified internucleoside linkage preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are nucleobase comprising a 5-methylcytosine. The antisense compounds are nucleobase comprising a 5-methylcytosine of p13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders and and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #64.
                                                                                                                                                                                                                                                                                                                                                      Gaps

The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e a phosphorothioate linkage, at least one modified internucleoside linkage i.e a phosphorothioate linkage, at least one modified supar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics
nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PINK regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #74.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 molecule as an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are nucleobase comprising the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense
                                                                                                                              ô
and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonuclectide of the invention.

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense olisyoucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense olisyoucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified on uncleobase comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. and for preventing or treating hyperproliferative disorders and cancer), chediak-Higashi syndorme, neurodegenerative disorders and and in preventing or delaying infection or inflammation. This sequence and in preventing or delaying infection or inflammation. This sequence

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hydridises with a nucleic acid molecule encoding PI3K regulatory subunit hybridises with a nucleic acid molecule encoding PI3K regulatory subunit oligonucleotide comprises at least one modified. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, i.e. a phosphorothioate linkage, at least one modified sugar moiety, or at least one modified nucleobase comprising a 5-methylotrosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-1-kinase (PT3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically. hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 6, p150 and inhibits expression of the polypeptide. The antisense coligonucleotide comparises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancers), Chedlak-Higashi syndrome, neurodegenerative disorders and mattabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                       Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #26.
                                                                                                                              Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss, antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.4%; Score 20; DB 1; Length 20;

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 6, p150 and inhibits expression of the polypeptide. The antisense coligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety, or at least one modified or nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), checiak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or infilammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #42.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #66.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                          Human, phosphoinositide-1-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligomucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety; 5-methylcycosins; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotides inhibiting the expression of bhosphoinositide. 31-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comparises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyleytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer) checiak-Higashi syndrome, neurodegenerative disorders and may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human P13K regulatory subunit 4, p150 DNA antisense oligonucleotide #73.

The invention relates to a compound targeted to a nucleic acid molecule accoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding Pi3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothioare linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. and for preventing or delaying infection or inflammation. The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage oligonuclectide comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a PI3K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; phosphoinositide-3-kinase regulatory subunit 4; p150, p13K, P13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorder; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                              New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human PI3K regulatory subunit 4, p150 DNA target region #11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.4%; Score 20; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinosttide-1-kinase (PT3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 6, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar motety, preferably a 2'-0-methoxyethyl sugar motety, or at least one modified nucleothio comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (1.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and entabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar molety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                              New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g.

                                                                                                                                                                        The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 p150. The compound is an annisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding P13K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylytosine. The antisense compounds are useful for modulating the expression of F13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, phosphoinositide-3-kinase regulatory subunit 4; p150; PI3K; PI3 Kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation;
                                                                New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified in cucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modilating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and in preventing or delaying infection or inflammation. This sequence and in preventing or delaying infection or inflammation. This sequence of the incomplete of

                                                                                                                                                                                                                                                                                                                                                                     ઠ
                                                       The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising the expression of F13K regulatory subunit 4, p150 useful for modulating the expression of F13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage at least one modified sugar motety, preferably 2'-0-methoxyethyl sugar motety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gapв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (P13K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically thybridises with a nucleic acid molecule encoding P13K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage oligonucleotide comprises at least one modified internucleoside linkage preferably a 2'-0-methoxyethyl sugar motety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #60.
4, p150 and inhibits expression of the polypeptide. The antisense oligomucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified uncleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; p13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety; 5-metholycytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, cancoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, the compound is an antisense oligomucleoride that specifically cancer that an antisense oligomucleoride comprises at least one modified. The antisense oligomucleoride comprises at least one modified internucleoside linkage i.e. a phosphorothioare linkage, at least one modified sugar moiety, preferably a 2-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylorytosine. The antisense compounds are nucleobase comprising the expression of PI3K regulatory subunit 4, pISO useful for modulating the expression of PI3K regulatory subunit 4, pISO and for preventing or treathing hyperproliferative disorders and cancer), Chediak Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence
                                                                                                                                                                                                                              ö
                 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
for modulating the expression of PI3K regulatory subunit 4, p150
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; p13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methoxyethyl sugar sorder; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinostide-1-kinase (P13K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding P13K regulatory subunit 6, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comparises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chedlak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                       Human P13K regulatory subunit 4, p150 DNA antisense oligonucleotide #8.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150.

p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage 1.e. a phosphorothioset linkage, at least one modified sugar moiety, preferably a 2-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e.
                                                                                                                                                                                                                                                                                                       Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically chybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are nucleobase comprising the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), chediak-Higashi syndrome, neurodegenerative disorders and entabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence in represents an antisense oligonucleotide of the invention.
                                                                                                                             Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #68.
                                                                                                                                                                   Human, phosphoinositide-3-kinase regulatory subunit 4; p150; p13K; p13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar molety; 5-methoxycosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.4%; Score 20; DB 1; Length 20;

```
The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, plso and suppound is an antisense oligonucleotide that specifically compound is an antisense oligonucleotide that specifically the plso and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are nucleobase comprising the expression of PI3K regulatory subunit 4, plso and for preventing or treating hyperproliferative disorders (i.e. and for preventing or treating hyperproliferative disorders (i.e. and in preventing or delaying infection or inflammation. This sequence and in preventing or delaying infection or inflammation. This sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (P13K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding P13K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothioare linkage, at least one modified sugar moiety, or at least one modified nucleobase comprising a 5-methylotrosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a PIJK regulatory subunit 4, p150 DNA antisense

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense coligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified in nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of F13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or infilmmmation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense
Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 Kinase; ds; antisense oligonucledcide; phosphorothioate linkage; 2.-0-methoxyethy! augar moiety; 5-methyloytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial; antimicrobial; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, phosphoinositide-3-kinase regulatory subunit 4; p150; P13K, P13 Kinase; ds; antisense oligonucleocide; phosphorothioate linkage; 2-0-methoxyethyl sugar moiety; S-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides inhibiting the expression of bhosphoinositide-3 kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MAKE KENERAL KAK
```

```
The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hydridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage 1.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ds; antisense oligonuclectide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; inmicrobial; antinilammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial; antinflammatory.

```
The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically captures and the antisense oligonucleotide that specifically to the compound is an antisense oligonucleotide comprises at least one modified. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are uncleobase comprising the expression of F13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer). Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; phosphoinositide-3-kinase regulatory subunit 4; p150; PI3K; PI3 kinase; 85; antisense oligonuclectide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial; antinilammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                      New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

                                                                                                                                                                                                                                   The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (F13K) regulatory subunit 4, p150 The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding P13K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comparises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified sugar moiety, incleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #32.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding Pi3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioset linkage, at least one modified sugar molecy, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #48.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                   The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit hybridises with a nucleic acid molecule encoding PI3K regulatory subunit hybridises with a nucleic acid molecule encoding p13K regulatory subunit e.e. a phosphorothioate linkage, at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified supar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #52.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moietry; 5-methylcycosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;

The invention relates to a compound targeted to a nucleic acid molecule cenceding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, pls0. The compound is an antisense oligonucleotide that specifically cc hybridises with a nucleic acid molecule encoding PI3K regulatory subunit (2, pls0 and inhibite expression of the polypeptide. The antisense coligonucleotide comprises at least one modified internucleoside linkage of preferably a 2'-0-methoxychiy sugar moiety, or at least one modified crossing a 5-methylcytosine. The antisense compounds are nucleobase comprising a 5-methylcytosine. The antisense compounds are concer), chediak-Higashi syndrome, neurodegenerative disorders and cancer), chediak-Higashi syndrome, neurodegenerative disorders and modified modified disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human P13K regulatory subunit 4, p150 DNA antisense oligonucleotide #57.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antieense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcyfosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; hyperproliferative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;

encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, pl50. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, pl50 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, pl50 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #62.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 20; DB 1; Length 20;
Pred. No. 1.4e+02;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PISK) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PISK regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably a 2-0-methoxyethyl sugar moiety, or at least one modified uncleobase comprising a 5-methylrytosine. The antisense comprounds are useful for modulating the expression of PISK regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #69.
i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar molety, or at least one modified uncleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                 Gapa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 17 The compound is an antisense oligonucleotide that specifically charities with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense
                                                                                                                            ö
              metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders in entabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising the expression of P13K regulatory subunit 4, p150 uncleobase comprising a 5-methylcytosine. The antisense compounds are useful for modilating the expression of P13K regulatory subunit 4, p150 cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense coligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a PI3K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                  Human, phosphoinositide-3-kinase regulatory subunit 4; p150; P13K, P13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chedlak-Higashi syndrome; neurodegenerative disorder; metabolic disorder; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-Kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                              Human PI3K regulatory subunit 4, p150 DNA target region #40.
